Martin-Löf Randoms & D.N.C functions

Definition (Martin-Löf Random)

An infinite sequence S is Martin-Löf random if and only if

$$(\exists c)(\forall \sigma \prec S)(K(\sigma) \geq |\sigma| - c)$$

Definition (Diagonally Non-Computable function) A function f is DNC if

 $(\forall e)(f(e) \neq \Phi_e(e))$

Martin-Löf Randoms vs D.N.C functions

Theorem (Kjos-Hanssen, Miller)

The following are equivalent.

- A computes a DNC function.
- A computes an infinite subset of a 1-random set.

Trees

Definition (Tree)

A tree T is a set closed under prefixes:

$$\forall \sigma \in T, \, \tau \prec \sigma \Rightarrow \tau \in T$$

Definition (Measure of a tree)

$$\mu(T) \stackrel{def}{=} \lim_{n \to \infty} \frac{\operatorname{card} \left\{ \sigma \in T \ : \ |\sigma| = n \right\}}{2^n}$$

Path & Homogeneous set

Definition (Path in a tree) A set P is a path in a tree T if $(\forall \sigma \prec P)(\sigma \in T)$

Definition (Set homogeneous for a path in a tree) A set H is homogeneous for a path trough a tree T with color c if

 $(\forall n)(\exists \sigma \in T)(\forall x)(x \in H \upharpoonright n \to \sigma(x) = c)$

Some results

Theorem (A. Kucera, 1985)

A Martin-Löf random is a path (up to prefix) in a tree iff the tree has positive measure.

Theorem

There is a tree of positive capturing only Martin-Löf randoms.

0'-randoms and 0'-computable trees

Definition

A set S is 0'-random if it is random relative to 0'.

WWKL[0']

Every subtree of $2^{<\omega}$ of positive measure, computable in 0' has a path.

RWWKL[0']

Every subtree of $2^{<\omega}$ of positive measure, computable in 0' has a set homogeneous for a path.

Rainbow Ramsey Theorem

Definition (k-bounded function)

A coloring function $\mathbb{N}^n \to \mathbb{N}$ is k-bounded if $\operatorname{card} \{x \in \mathbb{N}^n : f(x) = c\} \le k$ for every color c.

$\mathbf{RRT}^{\mathbf{n}}_{\mathbf{k}}$ (Rainbow Ramsey Theorem)

For every k-bounded coloring function $f : \mathbb{N}^n \to \mathbb{N}$ there is an infinite set H such that $f \upharpoonright H^n$ is injective.

Erdös-Moser Theorem

Definition (Tournament)

A tournament is a set $T \subseteq \mathbb{N} \times \mathbb{N}$ such that

 $(x, y) \in T \leftrightarrow (y, x) \notin T$

Definition (Transitive tournament)

A tournament T is transitive if

$$(x,y)\in T\wedge (y,z)\in T\rightarrow (x,z)\in T$$

Definition (Stable tournament) A tournament T is stable if

$$(\forall x)(\exists y)[(\forall z > y)((x, z) \in T) \lor (\forall z > y)((x, z) \notin T)]$$

Erdös-Moser Theorem

Theorem (Bienvenu, Patey & Shafer)

The following statements are true over $\mathbf{RCA_0}$

- $\mathbf{EM} \to \mathbf{DNC}[\mathbf{0'}]$
- SEM \rightarrow DNC

Idea: Diagonalize (modulo encoding) against finite 0'-c.e. sets using tournaments (respectively finite c.e. sets using stable tournaments).

Question

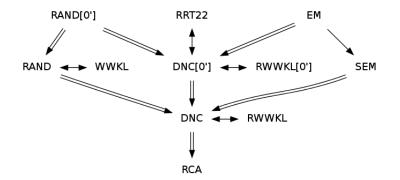

Is there a direct proof of $\mathbf{RCA_0} \vdash \mathbf{EM} \to \mathbf{RRT_2^2}$?

No Randomized Algorithm Property

Definition

A principle has the *NRA property* if adding randoms to the standard model (almsot surely) doesn't realize the principle.

Tip: A way to prove that a principle has the NRA property consist of creating an instance whose class of solutions is almost surely non-computed by an oracle.

Bienvenu - Patey - Shafer

New results in Ramsey Theory

April 12, 2013 41 / 49

No Randomized Algorithm Property

In particular, if a principle ${\bf P}$ has the NRA property, then

 $\mathbf{RCA_0} \not\vdash \mathbf{RAND}[\mathbf{0'}] \to \mathbf{P}$

Theorem (Bienvenu, Patey, Shafer) **SEM** has the NRA property

Idea: A "measure-risking argument" (like Antoine's talk) combined with a priority construction with finite injury.
