

Partial orders and immunity in reverse mathematics

Ludovic PATEY
IRIF, Paris 7

June 30, 2016

Many **theorems** can be seen as **problems**.

König's lemma

Every **infinite, finitely branching tree** admits an **infinite path**.

Some theorems are more **effective** than others.

Intermediate value theorem

For every **continuous function** f over an interval $[a, b]$ such that $f(a) \cdot f(b) < 0$, there is a **real** $x \in [a, b]$ such that $f(x) = 0$.

König's lemma

Every **infinite, finitely branching tree** admits an **infinite path**.

REVERSE MATHEMATICS

Q is at least as hard as P if

$$\text{RCA}_0 \vdash Q \rightarrow P$$

in a very weak theory RCA_0
capturing computable mathematics

(Harvey Friedman, 1974)

Turing ideal \mathcal{M}

- ▶ $(\forall X \in \mathcal{M})(\forall Y \leq_T X)[Y \in \mathcal{M}]$
- ▶ $(\forall X, Y \in \mathcal{M})[X \oplus Y \in \mathcal{M}]$

Examples

- ▶ $\{X : X \text{ is computable} \}$
- ▶ $\{X : X \leq_T A \wedge X \leq_T B\}$ for some sets A and B

Let \mathcal{M} be a **Turing ideal** and P, Q be **problems**.

Satisfaction

$$\mathcal{M} \models P$$

if every P -instance in \mathcal{M}
has a solution in \mathcal{M} .

Computable entailment

$$P \models_c Q$$

if every Turing ideal
satisfying P satisfies Q .

Fix two problems P and Q .

How to prove that $P \not\equiv_c Q$?

Build a Turing ideal \mathcal{M} such that

- ▶ $\mathcal{M} \models P$
- ▶ $\mathcal{M} \not\models Q$

PROVING $P \not\equiv_c Q$

Pick a Q-instance I with no I -computable solution

Start with $\mathcal{M}_0 = \{Z : Z \leq_T I\}$

Given a Turing ideal $\mathcal{M}_n = \{Z : Z \leq_T U\}$ for some set U ,

PROVING $P \not\equiv_c Q$

Pick a Q-instance I with no I -computable solution

Start with $\mathcal{M}_0 = \{Z : Z \leq_T I\}$

Given a Turing ideal $\mathcal{M}_n = \{Z : Z \leq_T U\}$ for some set U ,

1. pick some P-instance $X \in \mathcal{M}_n$

PROVING $P \not\equiv_c Q$

Pick a Q-instance I with no I -computable solution

Start with $\mathcal{M}_0 = \{Z : Z \leq_T I\}$

Given a Turing ideal $\mathcal{M}_n = \{Z : Z \leq_T U\}$ for some set U ,

1. pick some P-instance $X \in \mathcal{M}_n$
2. choose a solution Y to X

PROVING $P \not\leq_c Q$

Pick a Q-instance I with no I -computable solution

Start with $\mathcal{M}_0 = \{Z : Z \leq_T I\}$

Given a Turing ideal $\mathcal{M}_n = \{Z : Z \leq_T U\}$ for some set U ,

1. pick some P-instance $X \in \mathcal{M}_n$
2. choose a solution Y to X
3. let $\mathcal{M}_{n+1} = \{Z : Z \leq_T Y \oplus U\}$

Beware, while adding sets to \mathcal{M} ,
we may add a solution to the Q-instance!

A **weakness property** is a collection of sets closed downwards under the Turing reducibility.

Examples

- ▶ $\{X : X \text{ is low}\}$
- ▶ $\{X : A \not\leq_T X\}$ for some set A
- ▶ $\{X : X \text{ is hyperimmune-free}\}$

Fix a weakness property \mathcal{W} .

A problem P **preserves** \mathcal{W} if for every $Z \in \mathcal{W}$, every Z -computable P -instance X **has a solution** Y such that $Y \oplus Z \in \mathcal{W}$

Lemma

If P preserves \mathcal{W} but Q does not, then $P \not\leq_c Q$

Find the right weakness properties

- ▶ $WKL \not\leq_c ACA$ (cone avoidance)
- ▶ $RT_2^2 \not\leq_c ACA$ (cone avoidance)
- ▶ $EM \not\leq_c RT_2^2$ (2 hyperimmunities)
- ▶ $EM \not\leq_c TS^2$ (ω hyperimmunities)
- ▶ $TS^2 \not\leq_c RT_2^2$ (2 hyperimmunities)
- ▶ $RT_2^2 \not\leq_c TT_2^2$ (fairness property)
- ▶ $RT_2^2 \not\leq_c WWKL$ (c.b-enum avoidance)
- ▶ ...

RAMSEY'S THEOREM

$$RT_{k}^n$$

Every k -coloring of $[N]^n$ admits an infinite homogeneous set.

CAC

Every infinite **partial order** admits
an **infinite chain or antichain**.

Let $\mathcal{L} = (\omega, \leq_{\mathcal{L}})$ be a **partial order**.

$$f(\{x, y\}) = \begin{cases} 0 & \text{if } x <_{\mathcal{L}} y \vee y <_{\mathcal{L}} x \\ 2 & \text{if } x \mid_{\mathcal{L}} y \end{cases}$$

Any infinite f -homogeneous set
is a chain or an antichain.

$$\text{CAC} \not\equiv_c \text{RT}_2^2$$

(Hirschfeldt and Shore)

A function f is **DNC** if $(\forall e)[f(e) \neq \Phi_e(e)]$

Let $\mathcal{W}_{\text{DNC}} = \{Z : Z \text{ does not compute a DNC function}\}$

CAC preserves \mathcal{W}_{DNC} but RT_2^2 does not

$$\text{CAC} \not\equiv_c \text{RT}_2^2$$

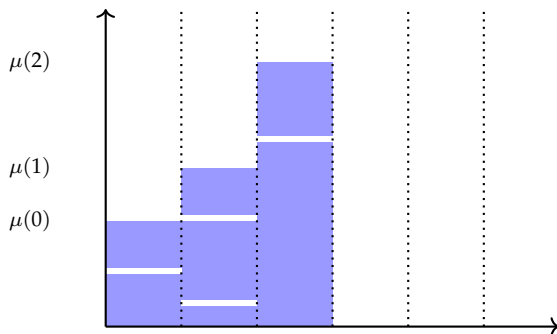

(Hirschfeldt and Shore)

A *k*-enum of X is a sequence $F_0 < F_1 < \dots$ of sets such that $|F_i| = k$ and $F_i \cap X \neq \emptyset$ for every $i \in \mathbb{N}$

Let $\mathcal{W}_{Enum}^X = \{Z : Z \text{ does not compute a } k\text{-enum of } X\}$

CAC preserves \mathcal{W}_{Enum}^X for every X , but RT_2^2 does not

There is an X with no computable k -enum such that every DNC function computes an infinite subset of X .

ADS

Every infinite **linear order** admits an **infinite ascending or descending sequence**.

Let $\mathcal{L} = (\omega, \leq_{\mathcal{L}})$ be a **linear order**.

$$x \leq_{\mathcal{P}} y \text{ iff } x <_{\mathbb{N}} y \wedge x \leq_{\mathcal{L}} y$$

Any infinite chain or antichain for \mathcal{P} is an ascending or descending sequence for \mathcal{L} .

ADS $\not\equiv_c$ CAC

(Lerman, Solomon and Towsner)

$\varphi(U, V)$ is **essential** if $(\forall x)(\exists R > x)(\forall y)(\exists S > y)\varphi(R, S)$

X, Y are **dependently Z-hyperimmune** if for every essential $\Sigma_1^{0,Z}$ formula $\varphi(U, V)$, $\varphi(R, S)$ holds for some $R \subseteq \bar{X}$ and $S \subseteq \bar{Y}$

Let $\mathcal{W}_{DH}^{X,Y} = \{Z : X, Y \text{ are dependently } Z\text{-hyperimmune}\}$

ADS preserves $\mathcal{W}_{DH}^{X,Y}$ for every X, Y , but CAC does not
